1 Effective Action

$$\Gamma_k = \int_x \left\{ \frac{1}{4} F^a_{\mu\nu} F^a_{\mu\nu} + Z_c(\partial_\mu \bar{c}^a) D^{ab}_\mu c^b + \frac{1}{2\xi}(\partial_\mu A^a_\mu)^2 \right. \tag{1}$$

$$+ \frac{1}{2} \int_p A^a_\mu(-p)(\Gamma^{(2)\,ab}_{AA\,\mu\nu} - Z_A \Pi^\perp_{\mu\nu} \delta^{ab} p^2) A^b_\nu(p)$$

$$+ \bar{q}[Z_q(\gamma_\mu D_\mu - \gamma_0(\hat{\mu} + igA_0)]q$$

$$- \lambda_q \sum_{a=0}^{8} [(\bar{q}T_a q)^2 + (\bar{q}i\gamma_5 T_a q)^2]$$

$$+ \bar{q} h_k^{1/2} \cdot \Sigma_5 \cdot h_k^{1/2} q + tr\left(Z_{\Sigma,k}^{1/2} \cdot \partial_\mu \Sigma \cdot Z_{\Sigma,k}^{1/2} \cdot \partial_\mu \Sigma^\dagger\right)$$

$$\left. + \tilde{U}_k(\Sigma, \Sigma^\dagger) + V_{glue}(L, \bar{L}) \right\}$$

here, the meson field :

$$\Sigma = T^a(\sigma^a + i\pi^a). \quad (a = 0, 1, ..., 8) \tag{2}$$

and

$$\Sigma_5 = T^a(\sigma^a + i\gamma_5 \pi^a). \quad (a = 0, 1, ..., 8) \tag{3}$$

with $T^a = \lambda^a/2 (a = 1, ..., 8)$ and $T^0 = \frac{1}{\sqrt{2N_f}} \mathbb{I}_{N_f \times N_f}$ are generators of $SU(N_f = 3)$. σ^a and π^a mean the scalar and pseudoscalar fields, respectively. The physical meson can be written obviously:

$$\Sigma = \frac{1}{2} \begin{pmatrix} a_0^0 + \sigma_L + i\pi^0 + i\eta_L & \sqrt{2}(a_0^+ + i\pi^+) & \sqrt{2}(\kappa^+ + iK^+) \\ \sqrt{2}(a_0^- + i\pi^-) & -a_0^0 + \sigma_L - i\pi^0 + i\eta_L & \sqrt{2}(\kappa^0 + iK^0) \\ \sqrt{2}(\kappa^- + iK^-) & \sqrt{2}(\bar{\kappa}^0 + i\bar{K}^0) & \sqrt{2}(\sigma_S + i\eta_S) \end{pmatrix} \tag{4}$$

the meson effective potential can be devided into three parts

$$\tilde{U}_k(\Sigma) = U_k(\rho_1, \rho_2) - c_A \xi - c_L \sigma_L - c_S \sigma_S, \tag{5}$$

here $U_k(\rho_1, \rho_2)$ is an arbitrary function of chiral symmetry invariant variables ρ_1, ρ_2. $c_A \xi$ is Kobayashi-Maskawa-'t Hooft trem which breaks $U_A(1)$ symmetry. The last two terms of Eq.(5) are linear sigma terms, which break the chiral symmetry. The ρ_1, ρ_2 are defined as:

$$\rho_1 = tr(\Sigma \cdot \Sigma^\dagger) \tag{6}$$

$$\rho_2 = \sqrt{6 \cdot tr\left(\Sigma \cdot \Sigma^\dagger - \frac{1}{3}\rho_1 \mathbb{I}_{3\times3}\right)^2} \tag{7}$$

And the effective potential is Taylor expaned as

$$U_k(\rho_1,\rho_2) = \sum_{i,j=0}^{N} \frac{\lambda_{ij,k}}{i!\,j!}(\rho_1 - \kappa_1)^i(\rho_2 - \kappa_2)^j \tag{8}$$

Here, we choose the expansion order $N = 5$.

On the vacuum expectation value,ρ_1,ρ_2 are given as:

$$\rho_1 = \frac{1}{2}(\sigma_l^2 + \sigma_s^2) \tag{9}$$

$$\rho_2 = \frac{1}{2}(2\sigma_s^2 - \sigma_l^2) \tag{10}$$

The Yukawa coupling

$$h_k = \begin{pmatrix} h_{l,k} & 0 & 0 \\ 0 & h_{l,k} & 0 \\ 0 & 0 & h_{s,k} \end{pmatrix} \tag{11}$$

and meson and quark wave function renormalization

$$Z_{\sigma,k} = \begin{pmatrix} Z_{\phi_l,k} & 0 & 0 \\ 0 & Z_{\phi_l,k} & 0 \\ 0 & 0 & Z_{\phi_s,k} \end{pmatrix} \qquad Z_{q,k} = \begin{pmatrix} Z_{l,k} & 0 & 0 \\ 0 & Z_{l,k} & 0 \\ 0 & 0 & Z_{s,k} \end{pmatrix} \tag{12}$$

At present, we assume $Z_{\sigma,k} = Z_{\pi,k}$.

The quark masses are given as (Appx(5)):

$$m_l = \frac{h_{l,k}}{2}\sigma_l \tag{13}$$

$$m_s = \frac{h_{s,k}}{\sqrt{2}}\sigma_s \tag{14}$$

And the meson mass squares are given from the Hessian matrix of the meson effective potential, i.e.

2 Flow Equations

The Wetterich equation with dynamical hadronisation reads

$$\partial_t \Gamma_k[\Phi] + \int \langle \partial_t \hat{\phi}_{k,i} \rangle \left(\frac{\delta \Gamma_k[\Phi]}{\delta \phi_i} + c_\sigma \delta_{i\sigma} \right) = \frac{1}{2}\text{Tr}(G_k[\Phi]\partial_t R_k) + \text{Tr}\left(G_{\phi\Phi_j}[\Phi] \frac{\delta\langle \partial_t \hat{\phi}_{k,i} \rangle}{\delta\Phi_j} R_\phi \right) \tag{15}$$

we assume

$$\langle \partial_t \hat{\phi}_k \rangle = \dot{A}_{l,k}[(\bar{q}T_a q) + (\bar{q}i\gamma_5 T_a q)] + \dot{A}_{s,k}[(\bar{q}T_b q) + (\bar{q}i\gamma_5 T_b q)] + \dot{B}_k \Sigma, \tag{16}$$

$$\text{for} \quad a = L, 1, \cdots 3, b = 4, \cdots 7, S$$

here T^L, T^S are given in Appendix 7 As pointed out in ref [] , we choose $\dot{B}_k = 0$. By taking the derivative of of each side of Eq. (15)

$$\frac{\overrightarrow{\delta}}{\delta(\bar{q}T^a q)}(Eq.(15))\frac{\overleftarrow{\delta}}{\delta(\bar{q}T^a q)}, \tag{17}$$

we get

$$-\partial_t \lambda_q + \dot{A}h_k = -\text{Flow}^{(4)}_{(\bar{q}T^a q)(\bar{q}T^a q)} \tag{18}$$

with the condication

$$\lambda_q \equiv 0, \quad \forall k \tag{19}$$

we get the renormalised hadronisation function

$$\dot{A} = -\frac{1}{\bar{h}_k}\overline{\text{Flow}}^{(4)}_{(\bar{q}T^a q)(\bar{q}T^a q)} \tag{20}$$

we split the expression

$$\dot{A}_{l,k} = -\frac{1}{\bar{h}_{l,k}}\overline{\text{Flow}}^{(4)}_{(\bar{q}T^L q)(\bar{q}T^L q)} \tag{21}$$

$$\dot{A}_{s,k} = -\frac{1}{\bar{h}_{s,k}}\overline{\text{Flow}}^{(4)}_{(\bar{q}T^S q)(\bar{q}T^S q)} \tag{22}$$

And to calculate the yukawa flow equation:

$$\frac{\delta}{\delta \sigma^a}\frac{\delta}{\delta(\bar{q}T^a q)}(Eq.(15)) \quad a = L/S \tag{23}$$

we get

$$\partial \bar{h}_{l,k} = \left(\eta_{l,k} + \frac{1}{2}\eta_{\phi,k}\right) - \frac{\delta^2 \bar{\bar{U}}(\Sigma)}{(\delta \bar{\sigma}_L)^2}\dot{A}_{l,k} + \overline{\text{Flow}}^{(3)}_{(\bar{q}T^L q)\sigma_L} \tag{24}$$

$$\partial \bar{h}_{s,k} = \left(\eta_{s,k} + \frac{1}{2}\eta_{\phi,k}\right) - \frac{\delta^2 \bar{\bar{U}}(\Sigma)}{(\delta \bar{\sigma}_S)^2}\dot{A}_{s,k} + \overline{\text{Flow}}^{(3)}_{(\bar{q}T^S q)\sigma_S} \tag{25}$$

A simpler way given in []

$$\frac{1}{\sigma^a}\frac{\delta}{\delta(\bar{q}T^a q)}(Eq.(15)) \quad a = L/S \tag{26}$$

and we get

$$\partial\bar{h}_{l,k} = \left(\eta_{l,k} + \frac{1}{2}\eta_{\phi,k}\right) - \frac{1}{\bar{\sigma}_L}\frac{\delta\bar{\bar{U}}(\Sigma)}{\delta\bar{\sigma}_L}\dot{\bar{A}}_{l,k} + \frac{1}{\bar{\sigma}_L}\mathrm{Re}\overline{\mathrm{Flow}}^{(2)}_{(\bar{q}T^L q)} \tag{27}$$

$$\partial\bar{h}_{s,k} = \left(\eta_{s,k} + \frac{1}{2}\eta_{\phi,k}\right) - \frac{1}{\bar{\sigma}_S}\frac{\delta\bar{\bar{U}}(\Sigma)}{\delta\bar{\sigma}_S}\dot{\bar{A}}_{s,k} + \frac{1}{\bar{\sigma}_S}\mathrm{Re}\overline{\mathrm{Flow}}^{(2)}_{(\bar{q}T^S q)} \tag{28}$$

the next step is to calculate the $\overline{\mathrm{Flow}}$ terms.

3   Result

Pressure:

$$\frac{p}{T^4} = \frac{U(0,0) - U((T,\mu)}{T^4} \tag{29}$$

and n-th order cumulats

$$\chi_n^B = \frac{\partial^n}{\partial(\mu_B/T)^n}\frac{p}{T^4} \tag{30}$$

$$\Delta_{l/s} = m_{l/s}^0\frac{\partial\Omega[\Phi_{\mathrm{EoM}};T,\mu_q]}{\partial m_{l/s}^0} = m_{l/s}^0\frac{T}{\mathcal{V}}\int_x\langle\bar{l}(x)l(x)/\bar{s}(x)s(x)\rangle, \tag{31}$$

$$\Delta_{l/s} \simeq -m_{l/s}^0 T\sum_{n\in\mathbb{Z}}\int\frac{d^3q}{(2\pi)^3}\mathrm{tr}\,G_{l\bar{l}/s\bar{s}}(q). \tag{32}$$

$$\Delta_{l/s,R} = \frac{1}{\mathcal{N}_R}\left[\Delta_{l/s}(T,\mu_q) - \Delta_{l/s}(0,0)\right]. \tag{33}$$

4

4 Appendix.A

The meson masses can be obtained by Hessian matrix:

$$H_{p,LL} = \frac{c_A \sigma_S}{\sqrt{2}} + U^{(1,0)} - U^{(0,1)} \tag{34}$$

$$H_{p,LS} = \frac{c_A \sigma_L}{\sqrt{2}} \tag{35}$$

$$H_{p,SS} = U^{(1,0)} + 2U^{(0,1)} \tag{36}$$

$$H_{p,11} = -\frac{c_A \sigma_S}{\sqrt{2}} + U^{(1,0)} - U^{(0,1)} \tag{37}$$

$$H_{p,44} = -\frac{c_A \sigma_L}{2} + U^{(1,0)} + \frac{\sigma_L^2 - 3\sqrt{2}\sigma_L \sigma_S + 4\sigma_S^2}{2\sigma_S^2 - \sigma_L^2} U^{(0,1)} \tag{38}$$

$$H_{s,LL} = -\frac{c_A \sigma_S}{\sqrt{2}} + U^{(1,0)} - U^{(0,1)} + (U^{(2,0)} - 2U^{(1,1)} + U^{(0,2)})\sigma_L^2 \tag{39}$$

$$H_{s,LS} = -\frac{c_A \sigma_L}{\sqrt{2}} + (U^{(2,0)} + U^{(1,1)} - 2U^{(0,2)})\sigma_L \sigma_S \tag{40}$$

$$H_{s,SS} = U^{(1,0)} + 2U^{(0,1)} + (4U^{(2,0)} + 4U^{(1,1)} + U^{(2,0)})\sigma_S^2 \tag{41}$$

$$H_{s,11} = \frac{c_A \sigma_S}{\sqrt{2}} + U^{(1,0)} + \frac{7\sigma_L^2 - 2\sigma_S^2}{2\sigma_S^2 - \sigma_L^2} U^{(0,1)} \tag{42}$$

$$H_{s,44} = \frac{c_A \sigma_L}{2} + U^{(1,0)} + \frac{\sigma_L^2 + 3\sqrt{2}\sigma_L \sigma_S + 4\sigma_S^2}{2\sigma_S^2 - \sigma_L^2} U^{(0,1)} \tag{43}$$

Because the nonvanishing nondiagonal element $H_{s/p,LS}$ we introduce the mixing angles between LS and physical basis:

$$\begin{pmatrix} f_0 \\ \sigma \end{pmatrix} = \begin{pmatrix} \cos \varphi_s & -\sin \varphi_s \\ \sin \varphi_s & \cos \varphi_s \end{pmatrix} \begin{pmatrix} \sigma_L \\ \sigma_S \end{pmatrix}, \tag{44}$$

$$\begin{pmatrix} \eta \\ \eta' \end{pmatrix} = \begin{pmatrix} \cos \varphi_p & -\sin \varphi_p \\ \sin \varphi_p & \cos \varphi_p \end{pmatrix} \begin{pmatrix} \eta_L \\ \eta_S \end{pmatrix}. \tag{45}$$

here

$$\varphi_{s/p} = \frac{1}{2} arctan \left(\frac{2H_{s/p,LS}}{H_{s/p,SS} - H_{s/p,LL}} \right) \tag{46}$$

so the square of meson mass are given as

$$m_{f_0}^2 = \cos^2 \varphi_s H_{s,SS} + \sin^2 \varphi_s H_{s,LL} - 2 \sin \varphi_s \cos \varphi_s H_{s,LS} \tag{47}$$

$$m_\sigma^2 = \sin^2 \varphi_s H_{s,SS} + \cos^2 \varphi_s H_{s,LL} + 2 \sin \varphi_s \cos \varphi_s H_{s,LS} \tag{48}$$

$$m_{a_0}^2 = H_{s,11} \tag{49}$$

$$m_\kappa^2 = H_{s,44} \tag{50}$$

$$m_\eta^2 = \cos^2 \varphi_p H_{p,SS} + \sin^2 \varphi_p H_{p,LL} - 2 \sin \varphi_p \cos \varphi_p H_{p,LS} \tag{51}$$

$$m_{\eta'}^2 = \sin^2 \varphi_p H_{p,SS} + \cos^2 \varphi_p H_{p,LL} + 2 \sin \varphi_p \cos \varphi_p H_{p,LS} \tag{52}$$

$$m_\pi^2 = H_{p,11} \tag{53}$$

$$m_K^2 = H_{p,44} \tag{54}$$

We can simplify them as

$$m_{f_0/\eta}^2 = \frac{H_{s/p,LL} + H_{s/p,SS}}{2} + \sqrt{(H_{s/p,LL} - H_{s/p,SS})^2 + 4H_{s/p,LS}^2} \tag{55}$$

$$m_{\sigma/\eta'}^2 = \frac{H_{s/p,LL} + H_{s/p,SS}}{2} - \sqrt{(H_{s/p,LL} - H_{s/p,SS})^2 + 4H_{s/p,LS}^2} \tag{56}$$

And the diagonal element of meson field become:

$$\Sigma_{(1,1)} = \frac{1}{2}(a_0^0 + \cos \varphi_s f_0 + \sin \varphi_s \sigma + i\pi^0 + i\cos \varphi_p \eta + i\sin \varphi_p \eta') \tag{57}$$

$$\Sigma_{(2,2)} = \frac{1}{2}(-a_0^0 + \cos \varphi_s f_0 + \sin \varphi_s \sigma - i\pi^0 + i\cos \varphi_p \eta + i\sin \varphi_p \eta') \tag{58}$$

$$\Sigma_{(3,3)} = \frac{1}{\sqrt{2}}(-\sin \varphi_s f_0 + \cos \varphi_s - i\sin \varphi_p \eta + i\cos \varphi_p \eta') \tag{59}$$

The coefficients in Eq.(28) are given as

$$\frac{1}{\sigma_L}\frac{\delta \tilde{U}(\Sigma)}{\delta \sigma_L} = -\frac{c_A \sigma_S}{\sqrt{2}} + U^{(1,0)} - U^{(0,1)} \tag{60}$$

$$\frac{1}{\sigma_S}\frac{\delta \tilde{U}(\Sigma)}{\delta \sigma_L} = -\frac{c_A \sigma_L^2}{2\sqrt{2}\sigma_S} + U^{(1,0)} + 2U^{(0,1)} \tag{61}$$

One interesting thing is that $\frac{1}{\sigma_L}\frac{\delta \tilde{U}(\Sigma)}{\delta \sigma_L} = m_\pi^2$.

the three-point meson vertex are defined as

$$\lambda_{\phi_i,\phi_j,\phi_l,k} = \frac{\partial^3 U_k(\Sigma)}{\partial \phi_i, \partial \phi_j, \partial \phi_l}\bigg|_{\phi_0} \tag{62}$$

because we assume

$$Z_\phi = Z_{\pi^+} \tag{63}$$

we choose the three-point meson vertex involve one π^+, which are given as

$$\lambda_{\pi^+\pi^- f_0,k} = \frac{c_A}{\sqrt{2}}\sin\phi_S + \cos\phi_S(U^{(0,2)} - 2U^{(1,1)} + U^{(2,0)})\sigma_L + \sin\phi_S(2U^{(0,2)} - U^{(1,1)} - U^{(2,0)})\sigma_S \tag{64}$$

$$\lambda_{\pi^+\pi^- \sigma,k} = -\frac{c_A}{\sqrt{2}}\cos\phi_S + \sin\phi_S(U^{(0,2)} - 2U^{(1,1)} + U^{(2,0)})\sigma_L - \cos\phi_S(2U^{(0,2)} - U^{(1,1)} - U^{(2,0)})\sigma_S$$
$$\tag{65}$$

$$\lambda_{\pi^+ a_0^- \eta,k} = \sin\phi_P \frac{c_A}{\sqrt{2}} + 6\cos\phi_P U^{(0,1)}\frac{\sigma_L}{2\sigma_S - \sigma_L} \tag{66}$$

$$\lambda_{\pi^+ a_0^- \eta',k} = -\cos\phi_P \frac{c_A}{\sqrt{2}} + 6\sin\phi_P U^{(0,1)}\frac{\sigma_L}{2\sigma_S - \sigma_L} \tag{67}$$

$$\lambda_{\pi^+\kappa^- K^0,k} = \lambda_{\pi^+ K^-\kappa^0,k} = \frac{c_A}{\sqrt{2}} + 6U^{(0,1)}\frac{\sigma_S}{2\sigma_S - \sigma_L} \tag{68}$$

5 Appendix.B

The quark masses are given as

$$M_q = \begin{pmatrix} m_{l,k} & 0 & 0 \\ 0 & m_{l,k} & 0 \\ 0 & 0 & m_{s,k} \end{pmatrix} = \frac{\overrightarrow{\delta}}{\delta\bar{q}}\Gamma_k\frac{\overleftarrow{\delta}}{\delta q}\Bigg|_{\Sigma=\Sigma_0} \tag{69}$$

with the condication Eq.(19),

$$M_q = \frac{\overrightarrow{\delta}}{\delta\bar{q}}\bar{q}h^{\frac{1}{2}}\Sigma_0 h^{\frac{1}{2}}q\frac{\overleftarrow{\delta}}{\delta q} = \begin{pmatrix} \frac{h_{l,k}}{2}\sigma_L & 0 & 0 \\ 0 & \frac{h_{l,k}}{2}\sigma_l & 0 \\ 0 & 0 & \frac{h_{s,k}}{\sqrt{2}}\sigma_s \end{pmatrix} \tag{70}$$

which are shown in Eq.(13).

The meson quark vertex are given by

$$V_{\bar{q}q\phi_i} = \frac{\delta}{\delta\phi_i}\frac{\overrightarrow{\delta}}{\delta\bar{q}}\Gamma_k\frac{\overleftarrow{\delta}}{\delta q} \tag{71}$$

7

here, we force on u and s quark anomalous dimension and Yukawa coupling, so meson quark vertex which are used:

$$V_{\bar{u}u\phi_i} = \frac{\delta}{\delta\phi_i} h_l \Sigma_{5(1,1)} \quad V_{\bar{u}d\phi_i} = \frac{\delta}{\delta\phi_i} h_l \Sigma_{5(1,2)} \quad V_{\bar{u}s\phi_i} = \frac{\delta}{\delta\phi_i} h_l^{1/2} h_s^{1/2} \Sigma_{5(1,3)} \tag{72}$$

$$V_{\bar{s}u\phi_i} = \frac{\delta}{\delta\phi_i} h_l^{1/2} h_s^{1/2} \Sigma_{5(3,1)} \quad V_{\bar{s}d\phi_i} = \frac{\delta}{\delta\phi_i} h_l^{1/2} h_s^{1/2} \Sigma_{5(3,2)} \quad V_{\bar{s}s\phi_i} = \frac{\delta}{\delta\phi_i} h_s \Sigma_{5(3,3)} \tag{73}$$

then we get

$$V_{\bar{u}uf_0} = h_l \cos\varphi_s/2 \quad V_{\bar{u}u\sigma} = h_l \sin\varphi_s/2 \quad V_{\bar{u}ua_0} = h_l/2 \tag{74}$$

6 Appendix.C

The Kobayashi-Maskawa-'t Hooft coupling $\bar{c}_A$, should decrease at high scalar and high temperatures. However, if we keep c_A a constant, and

$$\bar{c}_A = \frac{c_A}{Z_\phi^{3/2}} \tag{75}$$

$\bar{c}_A$ will increase with scalar and temperarure. One scheme is given in ref [?], which assume that $\bar{c}_A$ is a constant. However, this scheme cause a very sharp phase transitions. We assume c_A is a infrared enhancement function

$$c_A = c_{A,IR} \frac{1}{e^{\frac{k-k_{cut}}{\Delta_k}} + 1} \tag{76}$$

here $k_{cut} = 1GeV$ and $\Delta_k = 20MeV$. And $\bar{c}_A$ still dressed as $\bar{c}_A = c_A/Z_\phi^{3/2}$.

7 Appendix.D

As we known that

$$T_0 = \frac{1}{\sqrt{6}} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \quad T_8 = \frac{1}{2\sqrt{3}} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & -2 \end{pmatrix} \tag{77}$$

8

We have

$$\Sigma_0 = T_0 \sigma_0 + T_8 \sigma_8 = \begin{pmatrix} \frac{1}{\sqrt{6}} \sigma_0 + \frac{1}{2\sqrt{3}} \sigma_8 & 0 & 0 \\ 0 & \frac{1}{\sqrt{6}} \sigma_0 + \frac{1}{2\sqrt{3}} \sigma_8 & 0 \\ 0 & 0 & \frac{1}{\sqrt{6}} \sigma_0 - \frac{1}{\sqrt{3}} \sigma_8 \end{pmatrix} = \frac{1}{2} \begin{pmatrix} \sigma_L & 0 & 0 \\ 0 & \sigma_L & 0 \\ 0 & 0 & \sqrt{2} \sigma_S \end{pmatrix} = T_L \sigma_L + T_S \sigma_S \tag{78}$$

so

$$T_L = \frac{1}{2} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{pmatrix} \quad T_S = \frac{1}{\sqrt{2}} \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix} \tag{79}$$

8 Appendix.E:mesons anomalous dimension

As assumed above,

$$\eta_\phi = \eta_{\pi^+} \tag{80}$$

and we get

$$\begin{aligned} \eta_\phi(0) = \frac{\bar{Z}_\phi}{Z_\phi(0)} \Bigg\{ & \frac{1}{3\pi^2 k^2} \Big[\bar{\lambda}_{\pi^+ \pi^- f_0}^2 \mathscr{B}\mathscr{B}_{(2,2)}^{(\pi,f_0)} + \lambda_{\pi^+ \pi^- \sigma}^2 \mathscr{B}\mathscr{B}_{(2,2)}^{(\pi,\sigma)} + \lambda_{\pi^+ a_0^- \eta}^2 \mathscr{B}\mathscr{B}_{(2,2)}^{(a_0,\eta)} \\ & + \lambda_{\pi^+ a_0^- \eta'}^2 \mathscr{B}\mathscr{B}_{(2,2)}^{(a_0,\eta')} + (\lambda_{\pi^+ \kappa^- K^0}^2 + \lambda_{\pi^+ K^- \kappa^0}^2) \mathscr{B}\mathscr{B}_{(2,2)}^{(K,\kappa)} \Big] \\ & + \frac{N_c h_{l,k}^2}{6\pi^2} \Big[(2\eta_{l,k} - 3) \mathscr{F}_{(2)}(\tilde{m}_{l,k}^2; T, \mu_q) - 4(\eta_{l,k} - 2) \mathscr{F}_{(3)}(\tilde{m}_{l,k}^2; T, \mu_q) \Big] \Bigg\} \end{aligned} \tag{81}$$

$$\eta_\phi(0,k) = \frac{1}{3\pi^2 k^2}\Big[\bar{\lambda}^2_{\pi^+\pi^- f_0}\mathscr{B}\mathscr{B}^{(\pi,f_0)}_{(2,2)} + \lambda^2_{\pi^+\pi^-\sigma}\mathscr{B}\mathscr{B}^{(\pi,\sigma)}_{(2,2)} + \lambda^2_{\pi^+ a_0^-\eta}\mathscr{B}\mathscr{B}^{(a_0,\eta)}_{(2,2)}$$

$$+ \lambda^2_{\pi^+ a_0^-\eta'}\mathscr{B}\mathscr{B}^{(a_0,\eta')}_{(2,2)} + (\lambda^2_{\pi^+\kappa^- K^0} + \lambda^2_{\pi^+ K^-\kappa^0})\mathscr{B}\mathscr{B}^{(K,\kappa)}_{(2,2)}\Big] \tag{82}$$

$$-\frac{N_c}{\pi^2}\bar{h}_k^2\int_0^1 dx\Big[(1-\eta_{l,k})\sqrt{x}+\eta_{l,k}x\Big]$$

$$\times\int_{-1}^1 d\cos\theta\Bigg\{\Big[\Big(\mathscr{F}\mathscr{F}_{(1,1)}(\tilde{m}^2_{l,k},\tilde{m}^2_{l,k}) - \mathscr{F}_{(2)}(\tilde{m}^2_{l,k})\Big)$$

$$-\Big(\mathscr{F}\mathscr{F}_{(2,1)}(\tilde{m}^2_{l,k},\tilde{m}^2_{l,k}) - \mathscr{F}_{(3)}(\tilde{m}^2_{l,k})\Big)\Big]$$

$$+\Big[\Big(\sqrt{x}-\cos\theta\Big)\Big(1+r_F(x')\Big)\mathscr{F}\mathscr{F}_{(2,1)}(\tilde{m}^2_{l,k},\tilde{m}^2_{l,k})$$

$$-\mathscr{F}_{(3)}(\tilde{m}^2_{l,k})\Big] - \frac{1}{2}\Big[\Big(\sqrt{x}-\cos\theta\Big)\Big(1+r_F(x')\Big)$$

$$\times\mathscr{F}\mathscr{F}_{(1,1)}(\tilde{m}^2_{l,k},\tilde{m}^2_{l,k}) - \mathscr{F}_{(2)}(\tilde{m}^2_{l,k})\Big]\Bigg\}, \tag{83}$$

9 Appendix.F:quarks anomalous dimension

10 Appendix.G:Yukawa coupling

$$\partial_t\bar{h}_l = (\eta_l + \frac{1}{2}\eta_\phi)\bar{h}_l + \frac{1}{8\pi^2}\bar{h}_l^3\Big[3\mathscr{L}^{(l,a_0)}_{(1,1)} - 3\mathscr{L}^{(l,\pi)}_{(1,1)} + \cos^2\varphi_s\mathscr{L}^{(l,f_0)}_{(1,1)}$$

$$-\cos^2\varphi_p\mathscr{L}^{(l,\eta)}_{(1,1)} + \sin^2\varphi_s\mathscr{L}^{(l,\sigma)}_{(1,1)} - \sin^2\varphi_p\mathscr{L}^{(l,\eta')}_{(1,1)}\Big]$$

$$-\frac{3}{2\pi^2}\frac{N_c^2-1}{2N_c}g_{\bar{l}Al}\bar{h}_l\mathscr{L}^{(l,0)}_{(1,1)} \tag{84}$$

11 Appendix.H: Polyakov-loop potential

We empoly the parameterization Polyakov-loop potential from [?], that is

$$\bar{V}_{\text{glue-Haar}} = -\frac{\bar{a}(T)}{2}\bar{L}L + \bar{b}(T)\ln M_H(L,\bar{L}) + \frac{\bar{c}(T)}{2}(L^3 + \bar{L}^3) + \bar{d}(T)(\bar{L}L)^2 \tag{86}$$

with

$$M_H(L,\bar{L}) = 1 - 6\bar{L}L + 4(L^3 + \bar{L}^3) - 3(\bar{L}L)^2 \,. \tag{87}$$

for $x \in \{\bar{a}, \bar{c}, \bar{d}\}$

$$x(T) = \frac{x_1 + x_2/(t+1) + x_3/(t+1)^2}{1 + x_4/(t+1) + x_5/(t+1)^2} \tag{88}$$

and

$$\bar{b}(T) = \bar{b}_1(t+1)^{-\bar{b}_4}(1 - e^{\bar{b}_2/(t+1)^{\bar{b}_3}}) \tag{89}$$

the coefficients are list in table

The reduced temperature of QCD:

$$t_{\text{YM}} \to \alpha t_{\text{glue}}, \quad t_{\text{glue}} \equiv (T - T_c^{\text{glue}})/T_c^{\text{glue}} \tag{90}$$

here we choose

$$t_{\text{glue}} = 250[\text{MeV}], \quad \alpha = 0.42 \tag{91}$$
